

Paint. Stamp. Make it yours.

MDLxL 0.17.0 / Quick start for Warcraft III SD

1 Start with a model

Open your model, then Paint. Choose Edit the texture to keep its skin, or New base coat for a clean surface. Click Begin painting.

2 Pick where to work

Hold Shift and click a part to add it. Ctrl removes it. Choose Part / Geoset / Faces for the selection size. Ctrl+D clears it.

3 Add color

B paints. Choose a color, then C for related shadows and highlights. Try five brush shapes. D blends; keep its strength low. E erases the active layer.

4 Borrow a texture

Choose a starter, the WC3 library (J), or an image file. K cuts out a patch. Click the model to stamp; drag while pressed to position it. Release and stamp again.

Try this: gold armor + chainmail arms + a new shield. Undo is always Ctrl+Z.

Stay in control.

Four things that make the workflow click

Stamp just the edge

Select the part first. Hold R, move the stamp or brush center outside it, and click. Only the overlap with the visible model and your selection is painted. Release R to return to normal.

Cut and protect

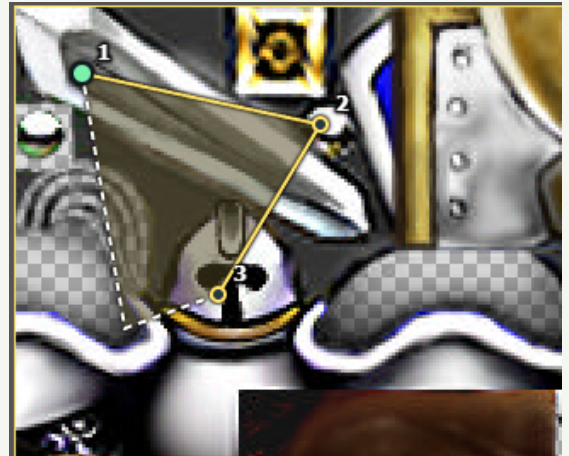

Polygon lasso: click corners, then the first point or Enter to close. Backspace removes a point; Esc cancels. Bright = selected, dark = protected. Use X to protect destination pixels; subtract around details.

Copy, mirror, rescue shared pixels

Select painted pixels or a model part, then Ctrl+C / Ctrl+V. M mirrors the stamp. If a glove changes with the face, select the part and use Separate this part (Ctrl+J). U opens UV adjustments below.

Keep the editable version

Ctrl+S saves a paint project with layers. Use paint on model applies it to the editor; then save the model normally. Export creates a Warcraft package. Use Keep to save a source patch in your library.

A polygon in progress: numbered corners + a live closing edge.

One source, three results

- 1 Full image: copy its colors.
- 2 Texture: borrow detail over your paint.
- 3 Highlights: borrow its light accents.

[]	Brush / stamp size
, / .	Rotate stamp
Alt + drag	Rotate model
Wheel	Zoom model or texture
Right drag	Pan texture
?	All shortcuts

Lost the shape? H adds view-only shading. O outlines parts. Y colors parts. These never repaint the model.
